

14270
Impact melt Breccia
25.59 grams

Figure 1: Photo of 14270. Sample is 4 cm across. NASA S71-26615.

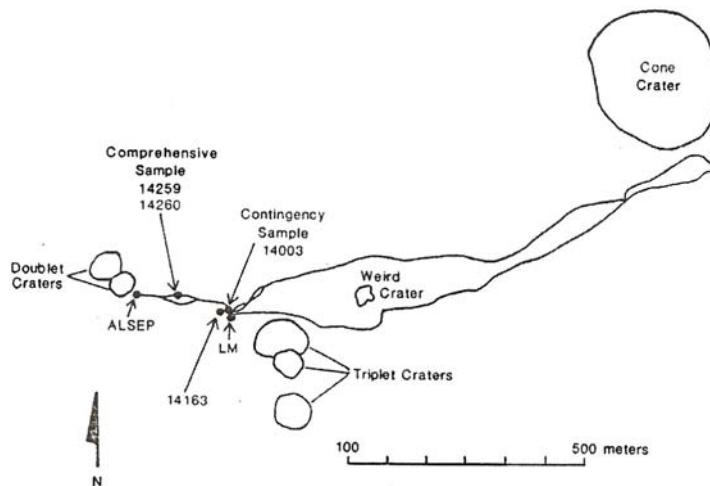

Figure 2: Location of comprehensive sample at Apollo 14.

Introduction

14270 was collected as part of the “comprehensive sample” taken near the ALSEP station (figure 2). It has glass-lined zap pits on all surfaces (Carlson and Walton 1977). It has been dated at 3.89 b.y., and has an exposure age longer than the samples from Cone Crater.

Petrography

Phinney et al. (1975) and Simonds et al. (1977) describe 14270 as a crystalline-matrix breccia. It is coherent, vuggy, and has a seriate grain size distribution. It is relatively clast-free (figure 3).

Anderson et al. (1972) pictured clasts of rhyolite in 14270 and found reaction halos around mineral grains indicating high temperature.

Chemistry

Lindstrom et al. (1972) analyzed 5 randomly (?) selected regions of 14270 (table 1).

Radiogenic age dating

Alexander and Kahl (1972) obtained an age of 3.89 ± 0.05 b.y. by the Ar39-40 plateau technique (figure 4).

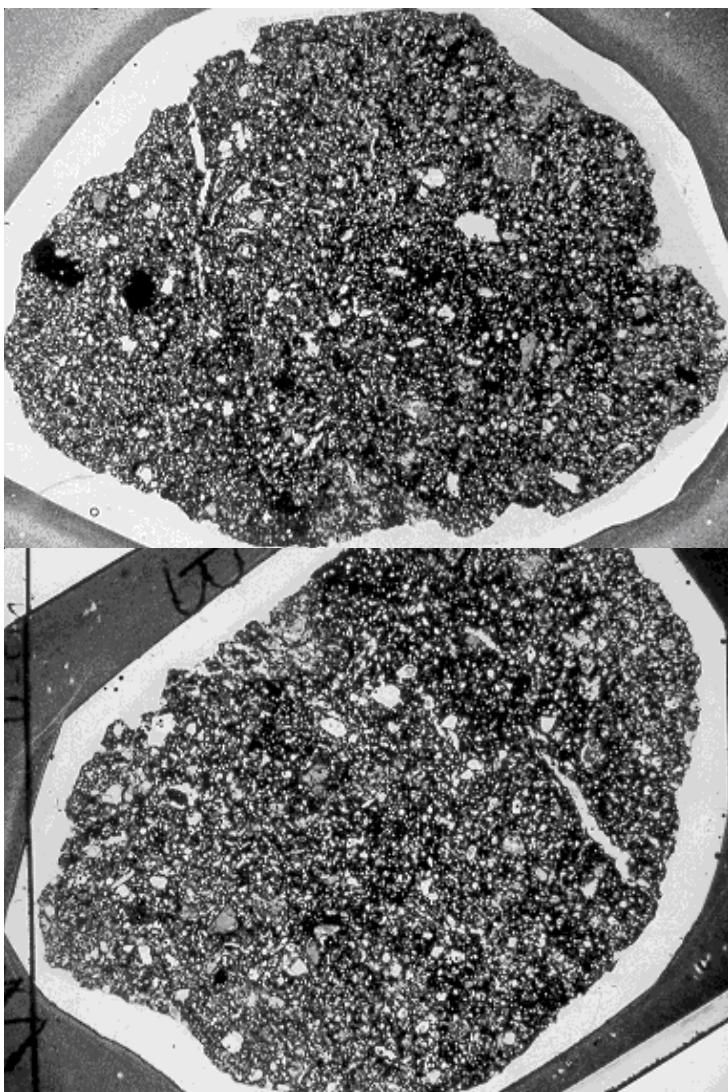

Figure 3: Photomicrographs of a) thin section 14270,10, b) 14270,9, each about 1.2 cm across.

Cosmogenic isotopes and exposure ages

Alexander and Kahl (1972) determined a cosmic-ray exposure age of 244 m.y. by the ^{38}Ar technique (figure 5). This is a great deal longer than that of the samples from Cone Crater.

Other Studies

Hart et al. (1972) determined the density of cosmic-ray tracks.

Processing

14270 was returned in weigh bag 1039, in ALSRC 1007. It was the subject of a consortium study by Gordy Goles.
